EZCORP | Pawn & Financial Services

Project walkthrough • USA client • July 2024 – December 2025

Quality assurance for business-critical financial workflows

BUSINESS DOMAIN

- Purchases, sales, and pawn loans
- Electronics, jewelry, and other merchandise

QA FOCUS

- UI and API automation
- Regression coverage and defect tracking

Project experience and results are based on the resume; production incident recalled by the presenter.

01 | Business workflows & test coverage

Start with risk and expected behavior, then validate across layers

WORKFLOWS

- Customer onboarding
- Pawn loan processing and repayments
- Inventory management
- Product sales and transaction flows

TEST DESIGN

- Business-critical positive scenarios
- Invalid input and boundary cases
- Transaction state and amount checks
- UI and API consistency checks

Testing priority: transaction correctness, traceability, and reliable regression.

02 | Automation framework & delivery

Reusable test components + API automation + continuous execution

UI AUTOMATION

- Java, Selenium WebDriver
- Playwright and TestNG
- Cucumber BDD
- Reusable utilities

API AUTOMATION

- Rest Assured
- Postman
- Backend response validation
- Business-flow integration

TEAM & DELIVERY

- Jenkins CI/CD
- Git source control
- JIRA defect management
- Agile collaboration

Design principle: maintainable scripts and repeatable release feedback.

03 | Real production performance issue

ACTUAL INCIDENT • Post-build delays affecting purchase and loan transactions

After an environment build, slow responses persisted and disrupted business-critical transactions.

01	**Observe**	Server downtime was expected during the build; delays continued afterward.
02	**Investigate**	QA traced logs and issue details using JIRA, Azure, and Jenkins.
03	**Identify**	Repeated user attempts during downtime contributed to transaction traffic.
04	**Fix & validate**	Shared findings with developers; retested and ran regression after their fix.

04 | Outcomes & takeaways

Project-level results reproduced from the resume

300+

automated business-critical scenarios

220+

API automation test cases

95%

regression automation coverage

60%

reduction in regression execution time

KEY TAKEAWAYS

• Prioritize business-critical workflows; combine UI and API checks; maintain reusable automation and CI feedback.

Metrics are resume-reported; the production challenge is based on the presenter's recollection.
